

I'll give you an example of testing I did for a US (User Story) from Swaps MXN Desk:
[\[DWS-5863\] Deploy Pricer and Curve Configuration Service for MXN desk - Darwin Jira](#)

The first thing I do is do a complete reading of the US to begin to familiarize myself with the scenario, after this, I begin to focus on the terms that I do not know, that are not clear to me, and I investigate them, in order to gain clarity. I try to put the puzzle together in my head, and once I have a good idea about the user story, its purpose, and the reason for the requirements. I give as much information as possible to an AI tool, my thoughts, my ideas, screenshots of Darwin and the jira ticket, documentation, messages with the person who assigned me the task, comments from the devs, etc. And with this, you will most likely have a much broader vision than you had at the beginning.

Deploy Pricer and Curve Configuration Service for MXN desk

▼ Descripción • Cambios sin guardar

As a trader, I need a PIL-based pricer for MXN Outrights and Lists.

Requirements

- Integrate the latest BSI-Fly
- Update the deployments for the MXN desk to include:
 - Merlin
 - Curve Configuration
 - Marlon
- Assume there will be a market data service for MXN, and the deployment should take that into account (see the linked dependency). The RICs mentioned in [\[DWS-5864\] Market Data for MXN Desk - Darwin Jira](#) need to be selectable in the Curve Configuration to facilitate testing.
- Ensure excel add-in "=StreamPrices()" function works with the MXN environment after the pricer is deployed.
- Ensure that the contribution service works with the live pricer post-deployment

Testing Instructions

- Log into Darwin with user assigned to the MXN desk, upload a PIL, configure the curve inputs with valid pre-models (manual and hardcoded user inputs is fine), and use the excel add-in to check prices are generated with =StreamPrices()
- Ensure instrument seeding is done correctly such that RFQs would match to standard instruments, and the contributions instruments are correctly mapped to merlin outputs ids (from stream prices above) and send standard and custom rfq, check that a mid price is received in both cases (note: custom swap pricing will fail if the bug linked is not fixed 🚨 [DWS-3735: Book to Trading Desk Mapping will fail for desks other than gbp, euritm, eurstm and usd](#) **RAISED**)

Sometimes, it may happen that we need a little more context, more information about how the developer implemented the requirements, so there is the possibility of communicating personally with the dev and asking them the necessary questions to finally solve the mental puzzle.

In the end, all this information helps us to understand what we are about to test. To verify that something works or not, we first must understand the logic behind it.

So, as you may have read in the last documentation I sent you ([X-Ray Test management - cib_rates-credit - Confluence](#)):
“Every story should be covered by testcases.”

To create a test case, follow the instructions below. Let us now consider the following US: [\[DWU-169\] Reference Data: Add "Pricing Format" dropdown to Bond Referential to enable selection of "32nd/decimal" formats - Darwin Jira](#)

II. Creating new Test Case

Every story should be covered by testcases. This action is obligatory.

To create new test case we have to follow few rules. Mandatory fields are marked on the screenshot below. For scenario description we can use classic Step→Expected result convention as well as Gherkin scenario. Test description way has to be consistent within the project.

Projects / Darwin Bonds / DWS-2178

Create Refinitiv subscriptions per bond - Page Content

Attach Create subtask Link issue Test details

Description
Basic changes on UI regarding Refinitiv subscriptions per bond. Check whether all UI elements are present on the page, regarding to DWS-1501: Implement Price Model: Benchmark (manual spread) from market (data source APPROVED).
